Workshop Proposal: AI-assisted Long Video Creation

Abstract

We propose a CVPR 2026 workshop titled "AI-assisted Long Video Creation". The workshop centers on whether current models and tools can produce multi-shot, multi-minute videos that satisfy real users and creators. We will emphasize multi-shot generation model, creator workflows, and reproducible protocols for human evaluation, alongside technical advances in long-horizon modeling and controllability.

1. Workshop Summary

Recent progress in generative models has produced high-quality short, single-shot videos, but are still struggling to achieve long-form, multi-shot productions. Long videos present distinct technical and system challenges—global narrative structure, cross-shot character and style consistency, long-range temporal dependencies, multimodal alignment of audio and narration, and scalable human-in-the-loop editing—that require new modeling paradigms, evaluation protocols, and production-aware tooling.

Bilibili's large-scale creator ecosystem and production-grade data offer a real-world testbed to study these problems at scale and to evaluate models by real user and creator outcomes. This workshop will convene academic researchers, industry engineers, and content creators to define a technical roadmap, produce reproducible benchmarks and human-evaluation protocols centered on user satisfaction and creator workflows, and showcase methods through invited talks, peer-reviewed papers, and panel discussions.

1.1. Relationship to Previous Workshops

There have been several related workshops in recent CVPR, ICCV, ECCV, ICML, and NeurIPS, while our proposed workshop differs from them in scope and focus. Prior workshops such as CVEU at CVPR, ICCV [1, 2], AVGenL at ECCV 2024 [3] and recent workshops [6, 7] primarily explored creative media synthesis, multimodal alignment, and generative editing, but were limited to short-form or single-shot scenarios. The workshop at ICCV 2025 [4] and CVPR 2025 [5] further advanced long-horizon modeling and evaluation initiatives, yet mainly focused on algorithmic or benchmark construction. In contrast, our workshop explicitly integrates **human–AI co-creation, creator-centered evaluation, and user engagement metrics** into the study of long-form video generation. Leveraging the Bilibili creator ecosystem as a real-world testbed, we aim to connect academic research with creator workflows and audience responses. This human-grounded, platform-scale perspective differentiates our workshop by emphasizing practical utility, creator feedback, and narrative satisfaction—bridging the gap between model development and genuine user impact. In doing so, it complements existing creative AI workshops while introducing a new paradigm that evaluates generative models not only by visual fidelity but by their ability to sustain coherent, engaging, and emotionally resonant storytelling.

2. Call for papers

Generative systems for long-form video face both algorithmic and human-centered bottlenecks: models must represent and plan over long temporal horizons, yet evaluation and deployment must tie to real user outcomes and creator workflows. We invite papers that advance methods, evaluations, datasets, or systems that make progress on producing multi-shot, multi-minute videos that are useful, controllable, and ethically responsible. In this workshop, the state-of-the-art process and promising future directions of long video generation will be discussed, which will inspire new ideas and fantastic applications in related fields.

Our topics will include but not be limited to the following:

Narrative and Temporal Consistency: Long video generation faces the grand challenge of maintaining narrative coherence and visual-temporal consistency across tens of minutes. The ability to preserve story logic, character identity, and visual continuity requires hierarchical diffusion and long-horizon spatiotemporal memory architectures. How can we ensure scene transitions remain semantically aligned while allowing for creative divergence across shots?

Multimodal Fusion and Semantic Alignment: Video, audio, narration, and textual cues often evolve asynchronously in long-form content. Achieving unified latent representations that capture these multimodal dependencies

is essential for coherent synthesis. Can retrieval-augmented and cross-modal attention models bridge semantic gaps between modalities and enhance contextually grounded video generation?

Controllability and Editing: As creative tools, generative models must provide intuitive control for creators. How can we design interfaces that enable shot-level editing, pacing adjustment, or compositional re-arrangement while maintaining global coherence? Combining storyboards, scripts, and reinforcement learning may enable more human-aligned and interactive generation loops.

Knowledge-driven and Genre-specific Creation: Different genres—educational, performative, or animated—require domain-specific modeling of motion, emotion, and abstraction. What strategies allow generative models to adapt to distinct paradigms, from knowledge-grounded narration to stylized animation? How can we incorporate external knowledge and cultural priors into these processes?

Evaluation and Benchmarking: Traditional metrics such as FVD or CLIPScore fail to capture long-term story coherence, semantic richness, or user engagement. How can we design human-centric and behavior-informed evaluation protocols that better reflect creative quality and viewer satisfaction? What constitutes a fair benchmark for multi-shot, multi-modal video generation?

Human–AI Collaboration: Rather than replacing creators, generative models can amplify creativity. How can we construct co-creation workflows where AI systems assist with scriptwriting, scene composition, or multimodal synthesis while adapting to individual intent and style? What principles define effective human-AI interaction in large-scale storytelling?

2.1. Papers, Review and Proceedings

We plan an optional peer-reviewed paper track (workshop papers): Submissions should follow the main track CVPR format for 4 pages, shorter working-in-progress submissions with proof-of-concept demonstrations with live demos, code, and blog posts are welcome. Detailed submission guidelines and templates will be provided on the workshop website.

The timeline is listed as follows.

- Call for papers open: December 22th, 2025
- Submission deadline: March 1st, 2026
- Reviews returned: April 4th, 2026
- Camera-ready deadline: April 11th, 2026

Accepted workshop papers may be published in the CVPR workshop proceedings following CVPR guidelines.

Paper Review & Conflict of Interests. The paper review process will follow a double-blind format, ensuring anonymity for both authors and reviewers. We will reach out to diverse reviewers to provide a broad range of expertise. Each submission will be reviewed by at least 3 reviewers, and decisions will be made transparently by the organizing committee. To prevent conflicts of interest, the authors will be asked about potential conflicts via OpenReview. The final list of accepted papers will be published on the workshop website.

3. Workshop Details

3.1. Format and Logistics

Title: AI-assisted Long Video Creation

Abstract: This workshop explores how far current AI models are from producing long, multi-shot videos that truly satisfy users and creators. We will bring together researchers, engineers, and creators to discuss advances in long-horizon modeling, controllability, multimodal alignment, and human-AI co-creation. Through talks, papers, and panels, the workshop aims to define benchmarks, evaluation protocols, and design principles for AI-assisted long video creation.

Format: In-person workshop with Zoom support for hybrid attendance.

Expected size: Small (100 attendees).

Duration: Half-day (3.5 hours) with invited talks, a panel, paper session.

3.2. Preliminary schedule (half-day)

Time	Session
9:00am – 9:15am	Opening and Motivation
9:15am – 9:45am	Invited Talk 1
9:45am – 10:15am	Invited Talk 2
10:15am – 10:30am	Coffee Break
10:30am – 11:30am	Oral presentation Session
11:30am – 12:15pm	Panel Discussion
12:15pm – 12:30pm	Closing Remarks

3.3. Space and Equipment

- Expected oral count: 5 (10 min for each)
- AV: projector and Zoom setup provided by CVPR

4. Organizers and Contact

Organizing team:

- **Yudong Jiang** is the Head of Video Foundation Model Technology at Bilibili, leading research and development in generative AI for large-scale video creation. His work focuses on video generation, multimodal understanding, and creative AI systems that bridge cutting-edge models with real-world content production. He holds an M.S. in Computer Science from Fudan University and has over a decade of experience in AI, having led algorithm teams at Alibaba, Tencent, and ByteDance.

- **Lisai Zhang** is a Research Scientist at Bilibili. Lisai received his Ph.D. in Computer Science at Harbin institute of Technology. His research interests include multimodal foundation models, generative models for image and video. He serves as a program committee member of CVPR and AAAI, and reviewers for TPAMI, TCSVT, and TNNLS.
- **Siqian Yang** recevied his Ph.D. on Computer Science and Technology from Tongji University in 2018. He is currently a research scientist in BiliBli.inc, China. His research interests include video generation, image processing, computer vision, and vehicular networks.
- **Baohan Xu** received the BS and MS degrees in Computer Science from Fudan University, Shanghai, China. She currently works at Bilibili. inc as a Senior research scientist. Her research interests include video understanding and image/video generation.
- **Yanzhang Liang** serves as an Animation Production Executive at Bilibili Inc., whose research focus encompasses traditional animation and the integration of AI in animation production.
- **Zihao Zhang** is a Master's student in the School of Computer Science at Fudan University, advised by Prof. Zuxuan Wu, and currently an algorithm intern at Bilibili Inc. My research interests are in computer vision and deep learning, with a particular focus on image generation, video generation, and diffusion models.
- **Mingyu Yin** is a research scientist in BiliBli.inc, her research interest includes image and video generation, diffusion model.
- **Jing Liu** is a research scientist in BiliBli.inc. He received Master of Engineering degree from East China Normal Univeristy. His research interest includes video generation, diffusion model.
- **Siqi Wang** is a research scientist at Bilibili Inc. Her research focuses on video generation, diffusion models, and their applications in multimodal content creation..
- **Yidi Wu** is a research scientist in BiliBli.inc. Her interest includes video generation, diffusion model.
- **Hong Yuxin** is a research scientist in BiliBli.inc, her main work is video generation, lip-syncing. And her research interest includes diffusion model, multimodal generation.

5. Invited Speakers

Confirmed/tentative speakers will span industry, creators, and academia. Example tentative confirmations:

- **Zuxuan Wu** (Confirmed) is an Associate Professor at Fudan University and a member of the Fudan Vision and Learning Laboratory (FVL Lab). He received his Ph.D. in Computer Science from the University of Maryland in 2020, where he was advised by Prof. Larry Davis. His research interests lie in computer vision and deep learning, with a particular focus on large-scale video understanding, video generation, and efficient neural architectures.
- **Qi Dai** (Confirmed) is a Principal Researcher at Microsoft Research Asia (Beijing). He received his Ph.D. in Computer Science from Fudan University in 2017, where he was advised by Prof. Yu-Gang Jiang, and joined MSRA upon graduation. His research interests span computer vision and multimedia intelligence, with a particular focus on video understanding and generation — including action recognition, detection, representation learning, and related topics in large-scale video analytics.
- **Xia Ning** (tentative), a senior animation director, graduated from the 3D Animation major of the Hong Kong Polytechnic University. He has worked for the China Film Group and Shanghai TV Station, and is currently employed by Bilibili. He has a large number of film and television works. His works have won many national awards in China and global awards such as AEAF and AACA.
- **Sha Tong** (tentative) leads AI products for creators at Bilibili. He and his team are dedicated to leveraging AI to boost creators' productivity and creative capabilities, while exploring the future of AI-powered video creation tools. Their work encompasses the practical application of technologies such as video understanding, video generation, and video editing. Having previously worked at Baidu, where he was responsible for the product development of the Xiaodu Voice Assistant, he possesses extensive experience in building AI assistants and the practical application of voice-related technologies.

We will update speaker confirmations before the final submission deadline.

5.1. Broader Impact and Ethical Considerations

AI-assisted long video creation holds significant potential to democratize creative production and expand access to storytelling. By lowering the technical and economic barriers to producing high-quality videos, these systems can empower individual creators, small studios, and educators to express ideas at cinematic scale. The workshop also aims to promote open benchmarks, reproducible research, and interdisciplinary collaboration across computer vision, multimedia, and creative industries. Such efforts can drive community standards for evaluating and improving user satisfaction, narrative coherence, and ethical deployment of generative technologies.

Risks include misuse for misinformation and deepfakes, copyright violation, and automation effects on creative labor. We will feature an ethics panel and encourage papers to include mitigation strategies and evaluation of societal risks.
